

In your CSS you would set the grid-area to match the name you provided when naming the areas, and set it on that element.

CSS

```
#navbar {  
    grid-area: header;  
}
```

Once you do that the #navbar element will take up the top 4 rows of the grid you set up (previous page).

**HINT:** If you want to make sure an area exists, but does not actually have any content you can use a "." when naming the section.

Ex.

```
grid-template-areas:  
    "header header header header"  
    "main main . sidebar"  
    "footer footer footer footer"
```

Will look like this
