Grid Gap

The grid-gap property allows you to add a gutter between the columns and rows to space everything out a little bit. It is a shorthand for setting the gap on rows and columns independently.

grid-gap: <grid-row-gap> <grid-column-gap>;

Recap

In this introduction to CSS Grid we looked at the properties I suggest focusing on first off. Specifically: **display**, **grid-template-columns**, **grid-template-areas** and **grid-gap**. By getting comfortable with these properties first you will allow yourself to get comfortable setting up basic grid layouts.

Once you get comfortable and confident with these properties it will be time to start expanding your knowledge of CSs Grid properties, but start with setting up and controlling basic grid layouts first. Then add the complexity.
